

CREDITCOIN CC3 X ATTESTCOIN

WattLock

Certificate-backed compute allocation gate

A fixed CC3 escrow releases one payout only after
Attestcoin proves the exact Sepolia reservation.

LIVE TESTNET EVIDENCE

Public proof path. No wallet required.

wattlock.vercel.app/proof

Double allocation is the failure

The same certificate can appear valid to two downstream settlement paths when the source reservation and destination escrow do not share enforceable state.

WattLock turns that failure into one falsifiable rule:

**one terminal certificate reservation can authorize one exact
Creditcoin settlement.**

The product is deliberately narrow. It gates allocation eligibility before payout.

A single proof gate connects the two chains

WattLock binds the source reservation to the exact funded job before it releases the escrow.

01

CC3 job

Open and fund a fixed escrow

02

Sepolia lock

Reserve the exact allocation

03

Attestcoin

Prove the source receipt

04

WattLock

Validate every bound field

05

Payout

Release one fixed reward

The commitment binds the certificate, job, buyer, provider, reward, energy, deadline, destination chain, and WattLock contract.

One mismatch reverts. There is no reusable allocation credential.

Proof precedes payout

	Mechanism	Replay	Proof	FAQ	Inspect p			
	recomputed	Separately funded Job B; same certificate and its exact commitment hit CertificateAlreadyReserved()						
	recomputed	Identical Attestcoin proof replay: exact Query already processed refusal

What the judge can verify

SOURCE

Sepolia CertificateReserved event

PROOF

Attestcoin native verification on CC3

GATE

Exact allocation commitment match

RESULT

1 tCTC provider payout

The proof page links the source receipt, settlement transaction, contract, and verifier.

Reuse fails at both edges

SOURCE REFUSAL

Job B is funded separately, but the same certificate cannot be reserved again.

Sepolia returns CertificateAlreadyReserved().

DESTINATION REFUSAL

The identical Attestcoin query is submitted again to CC3.

CC3 returns Query already processed.

Two independent refusal receipts make the invariant inspectable instead of aspirational.

Inspect the claim in 90 seconds

recomputed	Separately funded job B; same certificate and its exact commitment hit CertificateAlreadyReserved()
recomputed	Identical Attestation proof replay: exact Query Already processed refusal.

Start here

Open the public proof page. It decodes the allowed settlement, both named refusals, transaction values, and mismatch checks without a wallet.

Public receipts

Allowed, then refused.

Certificate issued Test-only 1000 W3m certificate issued by DemoCertificateIssuer. Open Sepolia issuance	Job funded One C03 job opened with a fixed provider and a 1 tOTC escrow. Open C03 funding	Allocation reserved One terminal CertificateReserved event emitted on Sepolia. Open Sepolia reservation
Proof verified and escrow settled Attestation verification and W3m-cc3 settlement happened in this same C03 transaction. Open C03 settlement	Separately funded Job B blocked The same certificate against Job B's exact commitment reverted CertificateAlreadyReserved[] Open Job B source refusal	C03 query reply blocked The same Attestation proof submitted again reverted query already processed. Open C03 refuse

Terminal lock evidence Source refuse and destination refuse are both live.	Source issuer DemoCertificateIssuer	Settlement gate WattLockASC
	Source key	Destination

The command-line verifier cross-checks the same evidence from public chain data.

A narrow claim with strong evidence

WattLock proves a testnet certificate reservation can authorize one exact CC3 settlement, while reuse and proof replay are refused.

Proven now

- Sepolia source reservation
- Attestcoin proof in CC3 payout path
- Exact commitment validation
- Source and destination refusals
- Public, no-wallet judge path

Intentionally out of scope

- Physical renewable generation
- Production registry verification
- Hourly or geographic matching
- Hardware telemetry
- Actual compute delivery

The testnet issuer models an external certificate registry. The boundary is part of the product contract.
